

LiDAR & Flooding

Prof. Debra F. Laefer

Dept. of Civil & Urban Eng. & Center for Urban Science + Progress

Overview

1. Extreme pluviation
2. Storm surge
3. Illegal basement apts.
4. Low-lying infrastructure
5. Unfeasible evacuation

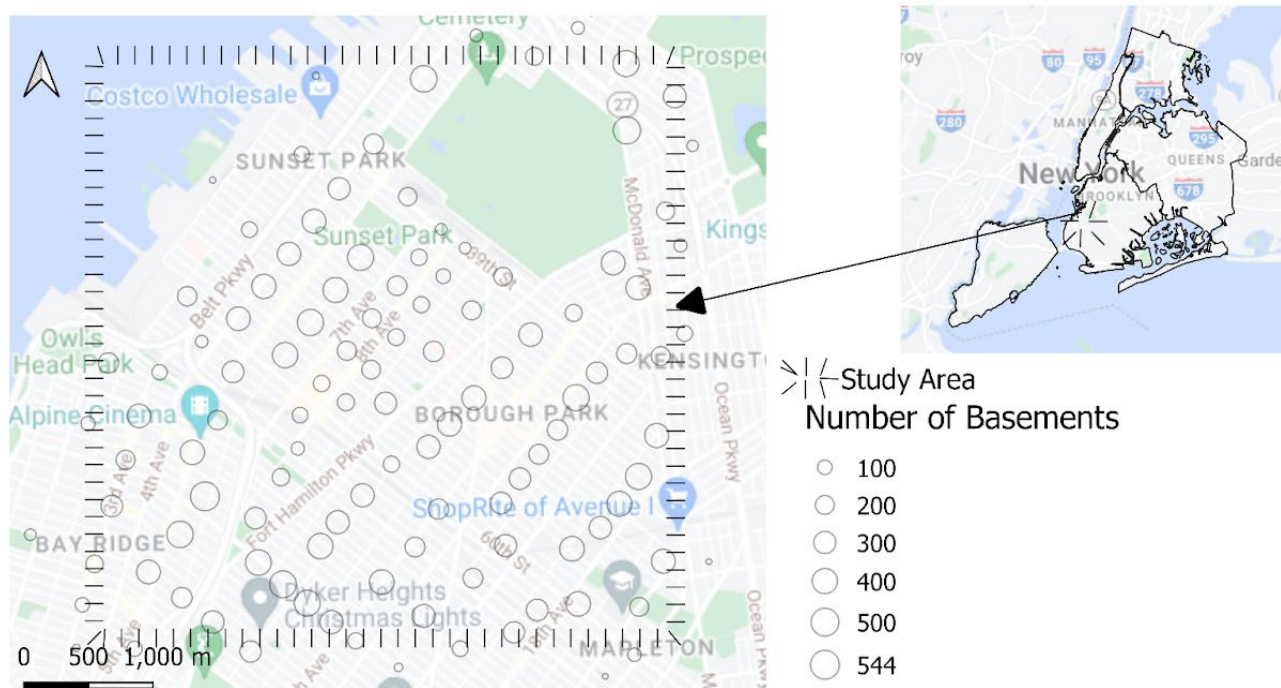

Visualization with basements as sinks

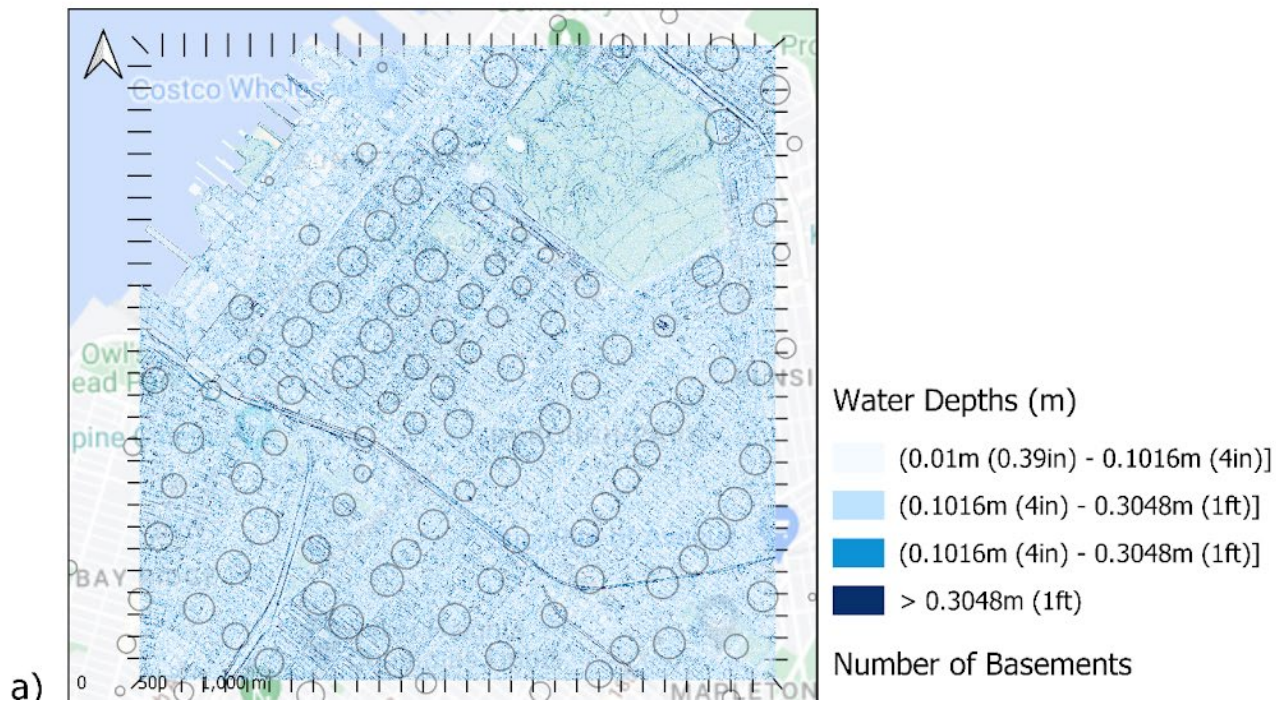

Visualization

Basement Risk

Nuisance Flooding

Interception

- Tree interception prevents precipitation from reaching the ground
- Storage ratio: 22.5% leaf, 77.5% bark

Objectives

1. Quantify tree surface water storage capacity for 20.25 km² of NYC
2. Visualize storage by block
3. Model 1 m² resolution

Foliar Storage

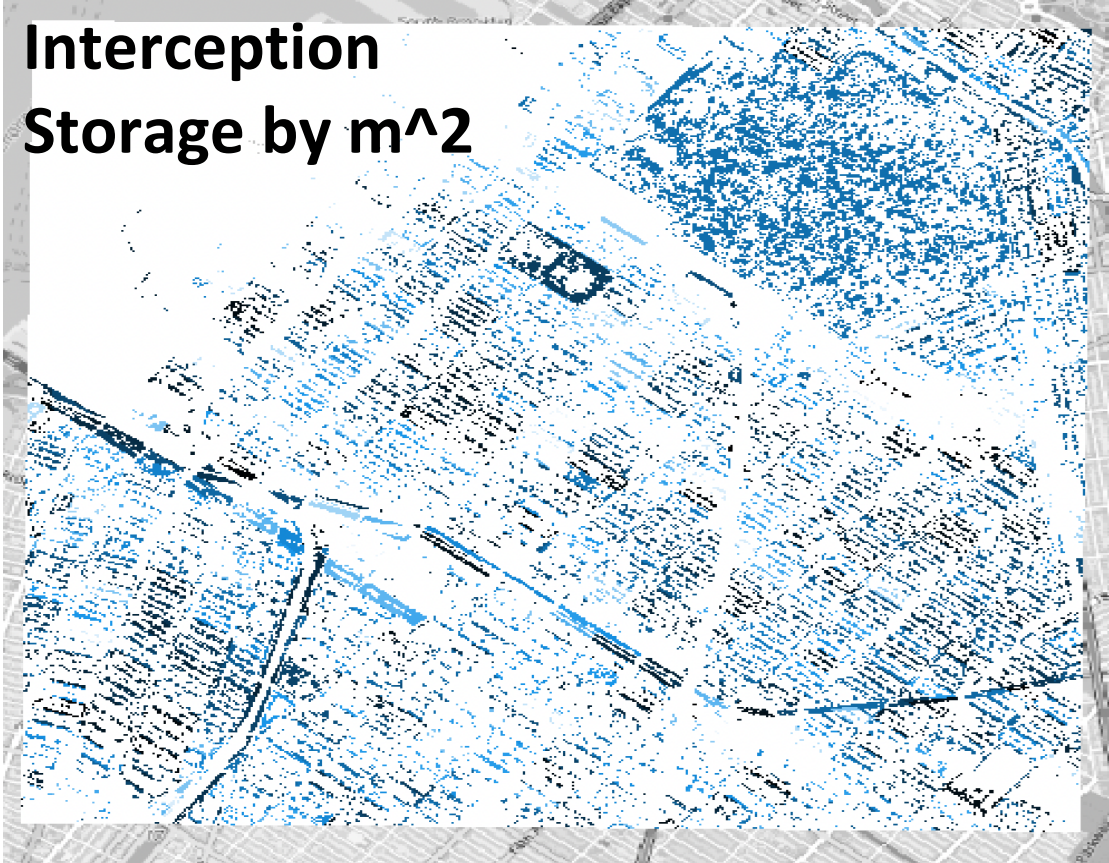

Bark Storage

Interception Storage by m^2

1.74 mil L total storage
0.34% of 2.54 cm (1-inch)
rainfall event intercepted

Canopy Storage (m)

Interception Storage Change

Interception

No interception
